AUTHOR: Kryszewski, Marian; Kurozewska, Halina; Szymanski, Aleksander

TITLE: Dependence of organic dielectric direct current conductivity upon operating conditions and external factors

SOURCE: Przeglad elektroniki, no. 4, 1964, 190-198

TOPIC TAGS: semiconductor, solid state physics, dielectric, organic dielectric, current conductivity, direct current conductivity, polystyrene, saran, thermoplastic resin, vinyl chloride, vinylidene chloride

ABSTRACT: The results of an analysis of direct current conductivity in high-molecular organic dielectrics are discussed. These dielectrics are polystyrene and saran (vinyl chloride and vinylidene chloride copolymer). The polystyrene structure was polar; the saran structure was non-polar. Authors found that polarization occurs in both types of polymers. This polarization causes a change in the current intensity flowing through the dielectric as a function of time. The polarization processes occur at a faster rate in the polar saran than in the non-polar polystyrene, i.e. a quasi-stationary current is obtained after the passage of a smaller time interval in the case of saran. The depolarisation currents, observed for both types of

Card 1/3

ACCESSION NR: AP4088545

dielectrics, can be described by the equation

$$I(t) = \sum_{i=0}^n I_i e^{-\lambda_i t}$$

Irradiation of the dielectrics by ultraviolet irradiation does not cause polarization decay, but it does, however, bring about a change in the depolarization time constant. The linear relationship between the applied voltage and current intensity flowing through the test sample is fulfilled only in the electric field intensity range of the order of  $10^5$  volts/cm. In the case of higher strengths of the applied field, the relationship  $I \propto V^n$ , where  $n \approx 1.5$ , is in conformity with the theory of the effect of the space charge on the dielectric conductivity. The through resistance of the dielectric depends upon the ultraviolet irradiation dosage. Changes in the resistance under the effect of ultraviolet irradiation occur especially clearly in the case of saran, which is subject to degradation more readily than polystyrene. The surface conductivity of the tested dielectrics depends upon the pressure and nature of the gas surrounding the test sample. Orig. art. has: 9 figures, 2 tables.

TITLE: Some electron phenomena in organic dielectrics 16

SOURCE: Przeglad elektroniki, no. 5, 1964, 205-216 21

TOPIC TAGS: dielectric material, electron mobility, electric conductivity

ABSTRACT: The article discusses one of the properties and parameters having an effect on the change of the property investigated of organic dielectrics: the conduction of direct electric current. Particular attention is given to the essence of the conduction mechanism of electric current in solid dielectrics, since previously published articles of a purely technological character concerned with the electrical properties of substances fail to do so, nor do they discuss the basic reasons for the change in conductivity. In the case of polymers containing double bonds, i.e., with mobile  $\pi$  electrons, the conduction mechanism has been considerably less investigated than in the case of organic crystalline substances. It is attempted to explain the conduction mechanism of organic dielectrics by resorting to the band model and by treating two extreme cases, viz., when organic dielectrics

Card 1/2

L 01068-66

ACCESSION NR: AP4041490

do and do not contain mobile  $\pi$  electrons. It is concluded that the basic parameters causing conduction in organic dielectrics may be put into two groups: 1) structural parameters determining the nature of carriers and traps; 2) external parameters (coercive factors) affecting the operation of the dielectric. Up to the present time, investigations of these phenomena have been carried out at the Lodz Polytechnic Institute. From the discussion of conduction in organic dielectrics it is shown that the stability of this property is a complicated problem. The conduction mechanism and the mechanism of the phenomena associated with the insertion of a dielectric in an electric field may be explained in its general traits by the band model. The adoption of such a theoretical base indicates the most important physical parameters determining conduction and in this way points the direction in which physical investigations should move in order to explain the physical basis for the changes occurring in organic dielectrics during their production as well as when they are functioning in electronic devices. Orig. art. has: 8 equations and 1 table.

AUTHOR: Kryszewski, M.; Mucha, M.

TITLE: Influence of UV-radiation on the glass transition temperature of the vinyl chloride-vinyldene chloride copolymer (Saran B)

SOURCE: Polska Akademia Nauk. Bulletin. Serie des sciences techniques, v. 13, no. 1, 1965, 53-58

TOPIC TAGS: glass transition temperature, ultraviolet irradiation, vinyl, vinyldene, copolymer/ Saran B copolymer

ABSTRACT: The glass transition temperature for simple vinyl copolymers is almost a linear function of the weight (or volume) fraction of both comonomers and depends on their glass transition temperatures. Copolymers containing ethylene and vinyl monomers in which isolated -CH<sub>2</sub>-CHR-CH<sub>2</sub>- groups exist have a constant glass transition temperature (between -10°C and -50°C depending on the nature of the alkyl group) within a wide composition range when the ethylene content is comparatively large. When the ethylene content in this type of copolymer is reduced past a certain point, the glass transition temperature gradually increases from the constant value up to the glass transition temperature of the homopolymer. In order to

Cord 1/7

L 27876-66

ACCESSION NR: AT5009476

determine whether vinyl copolymers modified by ultraviolet light behave like ethylene copolymers or like simple vinyl copolymers with respect to glass transition temperature, Saran B films 15-20  $\mu$  thick were subjected to ultraviolet radiation from a Philips 57413 P/40 TUV low pressure mercury lamp with a power of 30 watts. About 90% of the output from this UV source is at the resonance line ( $\lambda = 2537 \text{ \AA}$ ) strongly absorbed by Saran B. The irradiated samples were tested for density, gel content and glass transition temperature. Density and gel content are given as functions of irradiation time in figs. 1 and 2 of the Enclosure respectively. The glass transition temperature was determined by the dilatometric method, using Bekkedahl's dilatometer (N. Bekkedahl, J. Research N.B.S., 43 (1949), 371). The Saran B samples were placed in the dilatometer, heated to 50°C and degassed for several hours at a pressure of  $10^{-3}$  mm Hg before the instrument was filled with mercury. The dilatometer was then placed in a thermostat and held at a constant temperature  $10.05^\circ\text{C}$  for 30 minutes. The height of the mercury column was then used to find the specific volume as a function of temperature. The glass transition temperature occurs at the break point in the curve  $V = f(T)$  (see fig. 3 of the Enclosure). The glass transition temperature as a function of irradiation time for Saran B is shown in Fig. 4 of the Enclosure. It is concluded that ultraviolet radiation causes the glass transition temperature in Saran B to change from the

Card 2/7

L 27876-66  
ACCESSION NR: AT5009476

behavior observed for simple vinyl copolymers to that which occurs in copolymers of ethylene and vinyl monomers. A subsequent article will deal with cross-linking and degradation as functions of the glass transition temperature. Orig. art. has: 4 figures.

 by Swiss Railroads  
 Orig Pub. : Przeglad Kolejowy Mechan, 9, No 12, 358-361 (1957)  
 Abstract : The Swiss Railroad Administration uses quick-drying  
 PVA-based water-emulsion paints for railroad freight  
 cars. The drying rate of these paints on glass  
 plates at 18-20° is 2 hrs. The paints are not  
 damaged during transport in the winter and have  
 withstood tests in which they are cooled to -20°  
 for 2 hrs. The hardened films are not softened by  
 the application of a second coat of the same paint,  
 are resistant to abrasion, and do not contaminate  
 a cotton wad [sic! nonbleeding?]. PVA paints  
 must withstand two-year tests in which test panels  
 are exposed to the atmosphere on the roof of the  
 factory. Metal parts can be coated with PVA paints

TITLE: A Mobile Communications Department Trailer (Peredvizhnoye otdeleniye svyazi na pritsape)

PERIODICAL: Vestnik svyazi, 1958, Nr 9, p 20 (USSR)

ABSTRACT: The article describes the mobile postal and telephone department, the Drogobych Combined Communications Office. The unit consists of a van, fitted up as a small post office, which can be hitched to a truck for haulage and is set up in market places. Officials at tables outside the van sell fruit boxes and packaging materials for parcels. The finished packages are then registered and received in the van. Apart from the postal department, telephone facilities are also available. There is 1 photo.

Kryuchin, A. F.  
USSR/Mathematics - Sonic gas flow

FD-949

Card 1/1      Pub. 85-3/11

Author : Kryuchin, A. F. (Riga)

Title : Problem of near-sonic flow around a profile

Periodical : Prikl. mat. i mekh. 18, 547-560, Sep/Oct 1954

Abstract : A stabilized near-sonic gas flow in absence of friction and heat exchange is analyzed. As an example, a symmetrical flow around a wedge is computed under assumption that the disruption line is disconnected, the flow velocity at infinity exceeds little the sound velocity and the wedge has a narrow aperture angle. The distribution of pressure along the profile, the position and shape of the disruption line, and the equation of the sonic line are established. Indebted to L. V. Ovsyannikov. Seven references.

Title : The airflow around a v-shaped profile with a disconnected line of intensive flow separation.  
Periodical : Dokl. AN SSSR, Vol. 97, Ed. 1, 37 - 39, July 1954  
Abstract : A mathematical expression is formulated stating that, for a symmetric and uniform flow of gas around a v-shaped surface, a boundary-value problem, relative to the hodograph plane, is presented under certain conditions of absence of friction and heat transfer. In order to find the flow characteristics around the wedge, in the case of an intensive flow separation, a mixed-type ellipse-hyperbolic equation, must be solved. The article describes the method of solving this equation, transforming it, on the basis of Cauchy's theorem, into a simplified system of linear algebraic equations. Three USSR references (1947, 1952 and 1953).

Title : Drag of a diamond-shaped profile at trans-sonic velocities

Periodical : Dokl. AN SSSR, 97, Ed. 2, 205 - 208, July 1954

Abstract : The drag developed by a diamond-shaped surface on a gaseous stream flowing around the surface at trans-sonic velocities is analyzed. The analysis was made with the following assumptions: 1. Absence of friction; 2. The velocity of the stream be only slightly higher than that of sound; 3. The profile of the surface be comparatively thin. Four references.

USSR/Physics - Circumsonic flow

FD-2863

Card 1/1      Pub. 85-16/16

Author : Kryuchin, A. F. (Riga)

Title : Uniqueness theory of the solution to the problem of circumsonic gas flow around a wedge-shaped profile

Periodical : Prikl. mat. i mekh., 19, Sep-Oct 1955, 639-640

Abstract : The problem of the uniqueness for the gas-dynamic equation of Chaplygin  $K(s) P_{tt} + P_{ss} = 0$  was posed and solved by F. I. Frankl ("Problems of Chaplygin for mixed subsonic and supersonic flows," Izvestiya AN SSSR, Seriya matem., 9, No 2, 1945). In the present note the writer demonstrates in a similar manner the uniqueness of the problem of circulation around a wedge-shaped profile by an adiabatic gas flow in the absence of friction and heat exchange with disconnected shock wave; this problem is reduced to the solution of boundary-value problem like the ones discussed by L. V. Ovsyannikov ("Equations of circumsonic motion of a gas," Prikl. mat. i mekh., 18, No 6, 1954) and A. F. Kryuchin (Circulation of circumsonic flow around a profile," ibid., 18, No 5, 1954). Four references: e.g. F. Tricomi, Linear equations of the mixed type, translated into Russian by State Publishers of Theoretical and Technical Literature, 1947.

installation for polymerizing gaseous olefins, e.g. in production of low pressure polyethylene. The unit consists of two temperature controllers connected to a flow regulator for the product reactor, and a pressure regulator connected to the controller for the coolant. For increased productivity and optimization of the process, one temperature controller is connected through a speed reducer to the pressure controller which is connected through a second speed reducer to the flow regulator for the product reactor. The other temperature controller is connected to the flow regulator for the coolant.

Call No.: TS1925.X65

Author: KRYUCHKOV, A. P.  
Full Title: GENERAL TECHNOLOGY OF SYNTHETIC RUBBERS  
Transliterated Title: (Obshchaya tekhnologiya sinteticheskikh kauchukov)  
Publishing Data  
Originating Agency: None  
Publishing House: State Scientific-Technical Publishing House of Chemical  
Literature (GOSKhimizdat)  
Date: 1952 No. pp.: 364 No. of copies: 7,000  
Editorial Staff  
Editor: Frishman, R. A. Tech. Ed.: None  
Editor-in-Chief: None Appraiser: None  
Text Data  
Coverage: The book covers principles of physics and chemistry; basic information on modern methods of manufacturing synthetic rubber; preparation of starting materials for the manufacture of synthetic rubber; polymerization of monomers; separation of the polymer from the latex; and treatment of the polymer. Flow sheets of several processes and diagrams of apparatus are included. Safety technique and the organization and economics of production including wage scales are discussed.

This is a good textbook, but on an elementary level.
